

## Altair Deaerators

Deaerators are a high efficiency method of removal of dissolved gases from feedwater. Our Parallel Down-Flow design allows for maximum effective contact between water and steam, insuring maximum removal of dissolved gases. Parallel down-flow design also handles the most severe operating conditions, load swings, and 100% make-up requirements. Altair's 30 years of experience in the design and manufacture of Deaerators allows us to help solve your feedwater issues.
